

MARS EXPLORATION STUDENT DATA TEAMS  
MESDT

# MESDT Final Presentations

April 26<sup>th</sup>, 2012

## Today's Agenda

- Rick Snyder—Kickapoo High School
- Denise Thompson—Orting High School
  
- Time after each presentation for Q & A
- Final Decisions for the scholarship funding to be made by May 4<sup>th</sup>, 2012
  - 2012 Annual Meeting of Planetary Geologic Mappers
  - June 18-22, 2012
  - USGS Astrogeology Science Center in Flagstaff, AZ

A Mars rover is positioned on a reddish-brown, rocky surface. In the background, a large, dark, cratered planet (Mars) dominates the right side of the frame. The sky is a hazy, orange-red color with a bright sun or star in the upper center.

# ***Chasma Boreale: Cryptic Terrain as Indications of Sub-Surface Water and Stages of Geyser Formation***

***Jordyn Cloud, Sara Hickle, and Ravyn Vialpando***

***Kickapoo High School, Springfield, Missouri***

***May 28<sup>th</sup>, 2012***

***"We choose to go to the 'Poo not because it is easy..... but because it is hard"***

# Purpose of Research

*Our approach was to provide morphological and spectroscopic evidence of geysers and cryptic terrain demonstrating that these formations go through a progression of stages and that these stages can be used to indicate the location and level of subsurface water*

# *Area of Study: Chasma Boreale*

## Coordinates

83° North Latitude  
47° West Longitude

# Target Area: 84<sup>th</sup> Parallel of Chasma Boreale

*An image of Chasma Boreale as captured by THEMIS*

# Significance of Our Research

- *Distinguishing the stage of geyser/cryptic terrain development can be used as a morphological indication of the location/levels of subsurface water deposits*

# Definitions

- **Martian geysers:** Putative sites of jet-like eruptions that occur on Mars
- **Spiders:** Web like features formed through Martian geysers
- **Cryptic Terrain:** Unidentified types of landscape within a certain region of Mars
- **Albedo:** The diffuse reflectivity of a surface

# Background of Geyser Formation

## Martian Geysers or Illusion?

Graphic by Efrain Palermo

## Methods - Targeting

- Analyzed 36 high resolution images of geysers and cryptic terrain in the northern and southern hemisphere using CRISM, HiRISE, THEMIS, MOC, and MSSS to compare morphologies and mineralogies of northern and southern geysers.
- Priority was finding high concentrations of geyser activity in the northern hemisphere to optimize thorough analysis
- Compared Albedo measurements of geyser deposits in the northern and southern hemisphere using Adobe Photoshop and a formula approved by Scott Murchie (see next slide)
- Compared Martian seasons with Earth seasons using the following website <http://planetary.org/explore/topics/mars/calendar.html>

# Albedo Measurement Method

$$y=mx+b$$

$$\frac{\text{max.} - \text{min.}}{250}$$

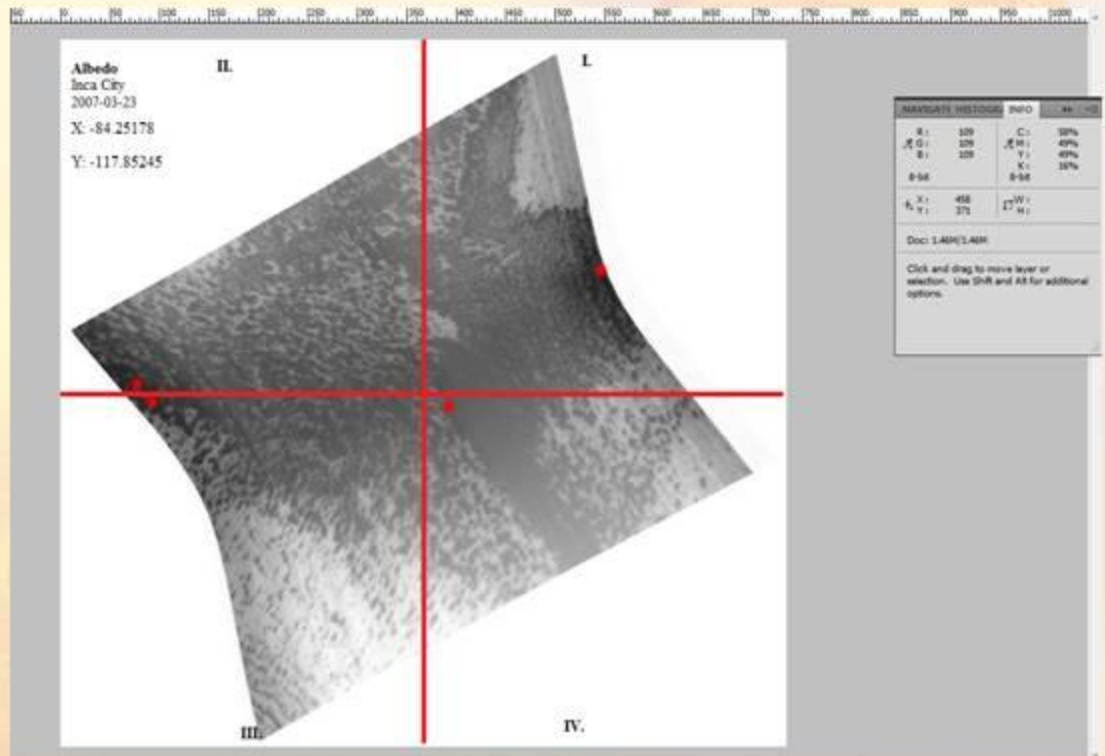

min.

Photoshop value  
0-250

```

Min_Longitude=73.8280 Max_Longitude=74.0818
Min_Latitude=19.3078 Max_Latitude=19.5375
X_resolution= 19.0701
Y_resolution= 19.2798
Projection: Cylindrical
Projection center:
Longitude = 0.00000, Latitude = 17.5000
Stretch:
Grey channel:
Min pixel value: 0.1104 = 0 DN
Max pixel value: 0.2414 = 250 DN

```

Example:  $\left( \frac{0.2414 - 0.1104}{250} \right) * 109 + 0.1104$

# Hypothesis One

- *Geysers can be used to determine the location of sub-surface water deposits based upon their current stage of development*

## Hypothesis Two

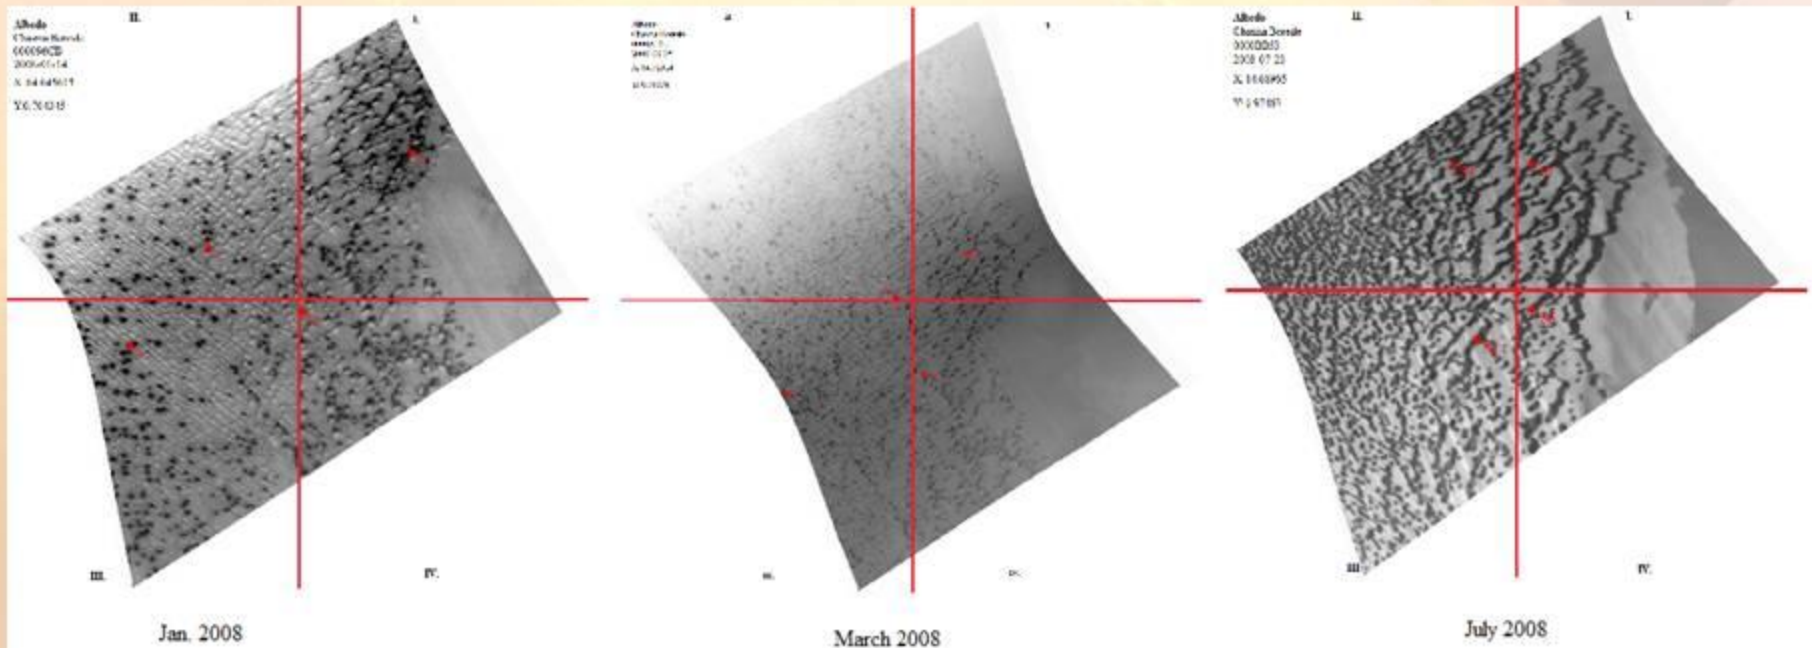

- *Once geysers have reached the third stage (Ness and Orme) of development they should indicate extensive “spider” networks indicating a deeper plumbing system and the possibility of accessing sub-surface water*

# Hypothesis Three

- Geysers in a later stage of formation (Stage 3) will have a lower albedo and therefore have a higher bound water content*

# ***Postulates and Observations***

## **Postulates: Ness and Orme**

## **Observations**

**There are different types of geysers, forming independently, and not in stages.**

**There are different types of geysers as a result of geysers being in different stages of formation.**

**Martian geysers are a seasonal occurrence, resulting in a short life span.**

**Geysers demonstrate seasonal activity, but are not seasonally created, resulting in a prolonged life span.**

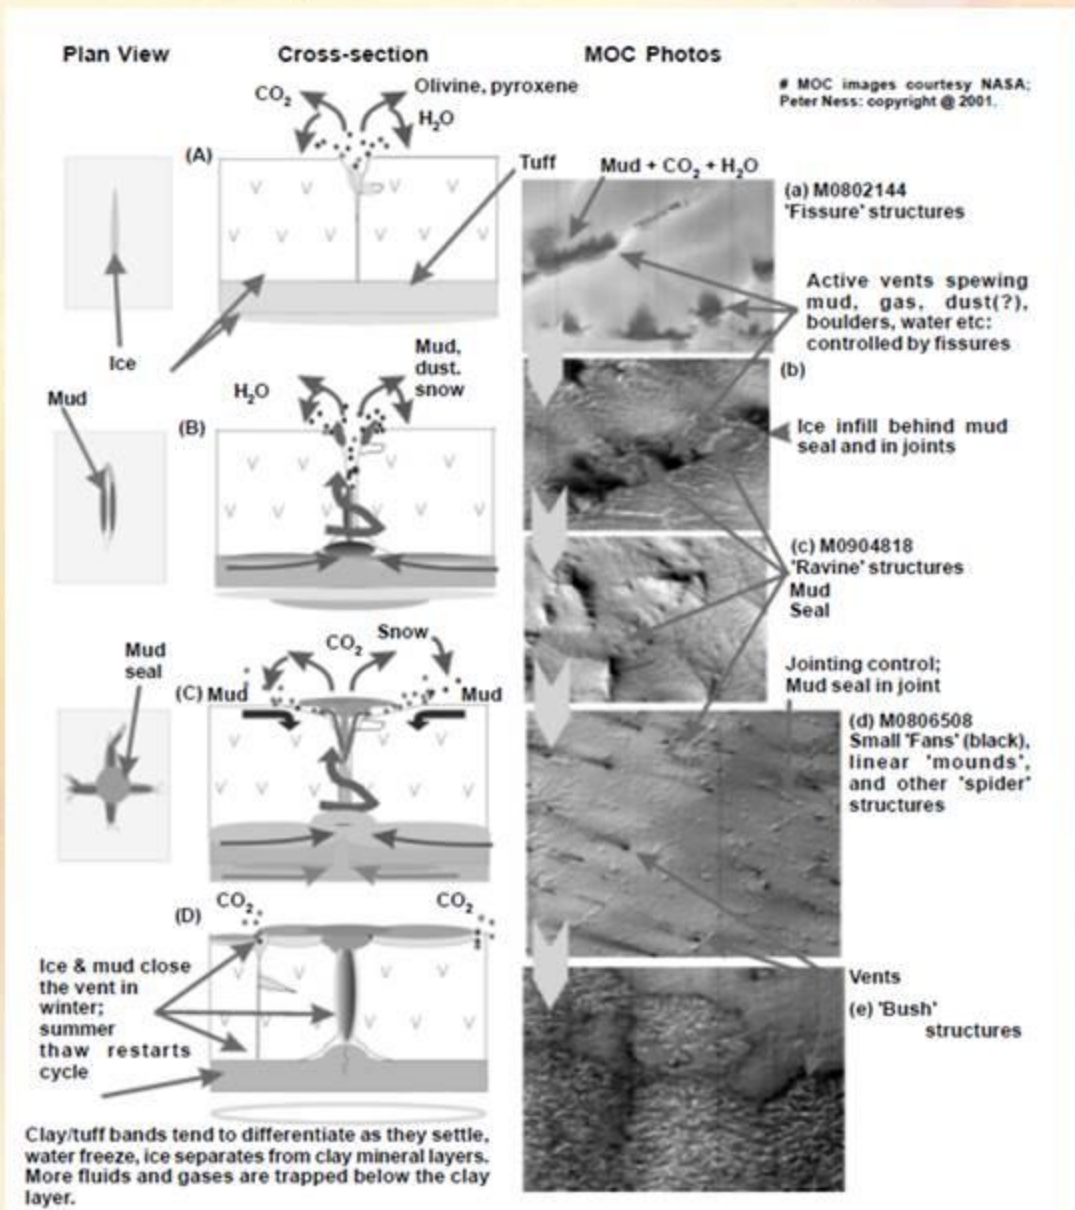

**Geyser activity is limited to the Southern Hemisphere.**

**Chasma Boreale (northern hemisphere) demonstrates distinct features associated with geysers and geyser development.**

# Background of Geyser Formation (Ness and Orme)

# Geyser Stage Model

- *Established based on comparisons to southern hemisphere and the research of Ness and Orme*
- *Stage One – Dry venting, fans with clear direction.*
  - *“Spewing”*
- *Stage Two – Similar fan features, lacking direction because more material has gathered around central vent*
  - *“Collecting”*
- *Stage Three – Mud caps, or mounds, form over central vent, fluids find other routes to the surface, tributary venting*
  - *“Network formation”*

# *Chasma Australe Stages*

# Chasma Boreal Albedo Values

Month:	Average:
January	.333
March	.467
July	.143

# Comparisons of Average Albedo Values

# Analysis

- *Lower albedo near Chasma Boreale geysers support that there is a higher water content.*
- *Spectral images from CRISM reveal high concentrations of bound water and water ice in Chasma Boreale.*
- *High resolution images from HiRISE and MOC indicate that Chasma Boreale geysers are following the progression of formation described in the geyser stage model.*

# Conclusions

- *Northern geysers are younger versions of the geysers found in the south because they lack spider networks, which also indicate that the northern geysers are shallower.*
- *Northern geysers will progress into stage three (network formation); therefore, delving down into the currently untapped reserves of deep, subsurface water.*
- *Chasma Boreale is an ideal area to investigate because of the abundance of geyser activity.*
- *Spring and early summer is the best time to capture geyser activity.*

# Questions/Comments?

# Candor Chasma as a Proposed Mars Mission Landing Site

Taylor Biggs  
&  
Bradley Renner  
*Orting High School*

# Introduction to the Mission

- Area of study: Candor Chasma:
  - south of Hebes Chasma and north of Valles Marinaris.
- Our prime science targets are to look at areas in this channel and evaluate whether there is or could have been water and life present.
- Location: 2.8 S, 74.62 W
- The closest area that has already been studied is at the Candor Chasma rim where the NASA Mars Odyssey researched.

Its All About...

LOCATION,

LOCATION,

LOCATION!!!

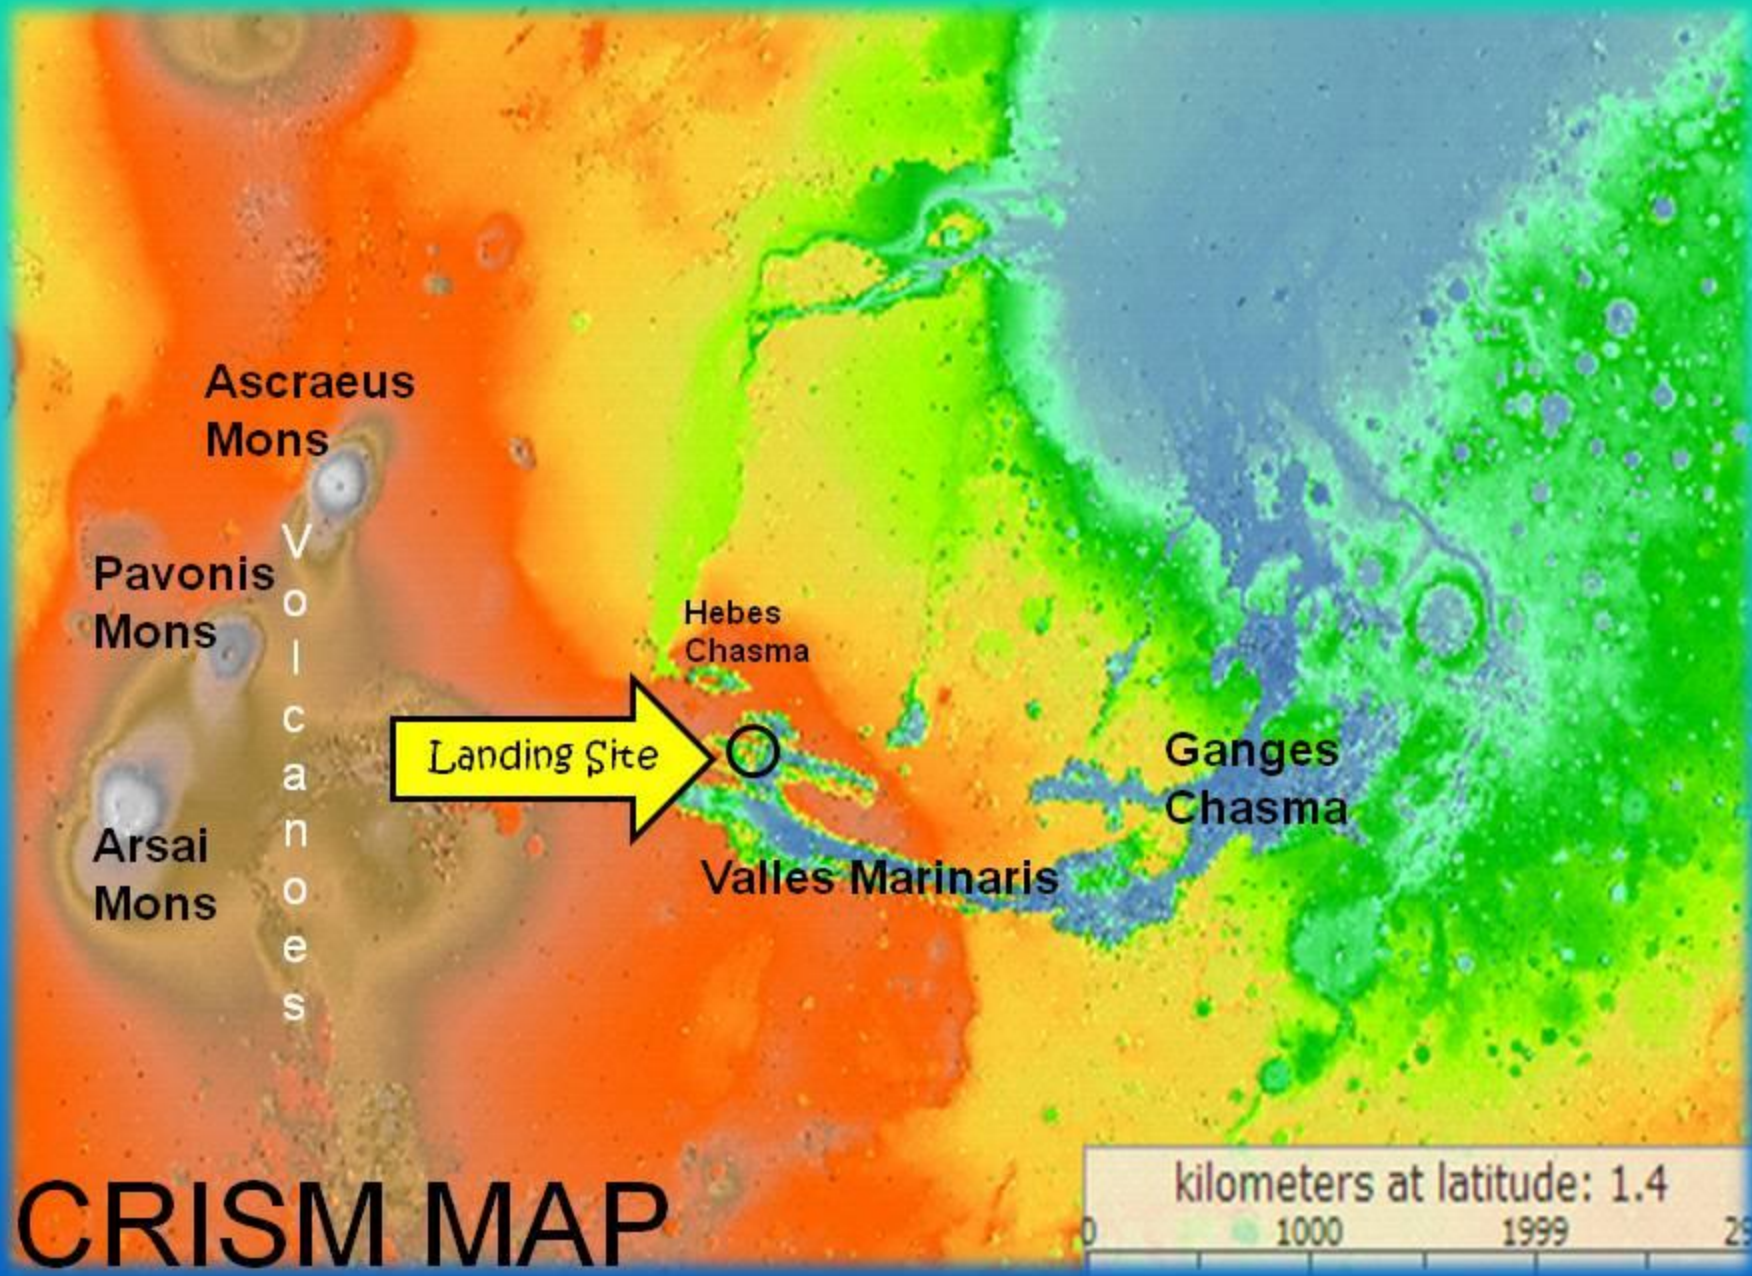

# Why Mars?

- It is important for us to research places outside of earth because earth's history has been washed away over time.
- Maybe earth used to look like Mars...
- We won't know unless we use our time and knowledge to research places outside of our planet.

# Adventure is out there!!

UP. 2009. Graphic. The New York Times, New York. Web. 26 Mar. 2012

# Engineering Constraints of the MSL (Mars Science Laboratory) Rover

- The wind levels: unknown
- If winds blow our rover off course dusty areas could wreck the rover.
- Slopes around area could be a hazard if blown off course.
- The MSL Rover needs to land at an elevation less than 1000m.
- Our elevation is -2500m compared to MOLA.
- The location is along the equator giving it plenty of light for photo electric power which ensures the rover wont have the possibility of freezing.

# Methods

- We targeted this area because it looks similar to areas on Earth. We wanted to know whether the area could have been created the same way it is on Earth because they look so similar.
- We observed the targeted area using a variety of instruments
- To assess the elevation and lay of the land we used MOLA
- For a higher resolution image of the region we used THEMIS
- To analyze the minerals present we used CRISM and JCAT

# Geologic History

- This area has:
  - Differences of elevations.
  - Different levels of calcium pyroxene in different layers.
  - There are volcanoes to the west.
  - These pieces of evidence cause us to conclude that lava has hardened into igneous rocks called basalt forming many layers.

# Hypothesis on the Formation of Candor Chasma

- Scientists propose that magma pooling underneath the surface caused swelling in the area where Valles Marinaris is found.
- This swelling caused a large crack to form.
- This cracking is called extensional fracturing.
- Water may have flowed through this area to make the crack expand.

# Channeled Scablands

- During the Ice Ages, A huge glacial lake burst and tremendous amounts of water flowed from Montana into Eastern Washington to form the Channeled Scablands.

- Notice the wide circled channel.

"Outflow Channels." *Euro Planet IDIS*. 07/06/2010. Web. 24 Apr 2012. <<http://europlanet.dlr.de/node/index.php?id=404>>.

# Mars vs. Earth

 **Channel on Mars**

**Channel on Earth** 

"Outflow Channels." *Euro Planet IDIS*. 07/06/2010. Web. 24 Apr 2012.  
<<http://europlanet.dlr.de/node/index.php?id=404>>.

- 
- Located in Yemen.
  - Formed by large amounts of water that used to flow here.
  - Water eroded dendritic patterns as it flowed from the high areas into the low areas.
  - The dry gullies are now “fossilized” due to the present dry conditions of the area.

# Mars vs. Earth

 **Channel on Mars**

**Channel on Earth** 

# Slope Streaks

- **Red** is covered by dust
- **Blue** is clear of dust
- Something is clearing the dust off of parts of the slope
- This could be caused by wind, water, or ice.

THEMIS 100  
meter global  
daytime  
mosaic:

## Chaos Terrain On Mars

## Death Valley California

Californian  
Geological Survey

# Water's Influence

- Even though scientists who study Mars theorize that Valles Marinaris was geologically formed there is surface feature evidence to suggest it has been altered by water.
  - Possible enlargement by flooding.
  - Surface erosion causing dendritic drainage patterns.
  - Chaos terrain caused by evaporation.
- There is also mineralogical evidence of water in this area.

# Important Minerals

- Hydrated aluminum phyllosilicates (clays) were found in these areas.
- Phyllosilicates are mostly formed in the presence of water.
- We also found minerals absorbed, dissolved, or bound by water which is an indicator of sulfates, which are formed when water evaporates.
- According to “Bacteria Back from the Brink” sulfates have been known to trap and preserve microbes in salt valleys for thousands to millions of years.

**Basalt**  
(Pyroxene and Olivine)

**Gypsum**  
(Sulfate)

**Clay**  
(Phyllosilicate)

Californian Geological Survey

# Chaos Terrain On Mars

- **Red** indicates evaporate minerals
- **Yellow** indicates monohydrated sulfates
- These same minerals have been known to trap halobacteria in salt valleys

- We analyzed several Browse Products like the one in the previous slide that we were not planning to look at with the MSL rover because we wanted to get more evidence of some kind of erosion or evidence of water.

## VISIBLE AND IR DERIVED PRODUCTS

We especially wanted to look at the calcium pyroxene to know about past lava flows.

# Conclusion:

- Mars and Earth have similar geological features such as channels.
- Similar processes are at work on both planets.
- There is evidence of hydrated minerals and clays that form mostly in the presence of water.
- There is evidence of sulfate minerals that could have trapped microbial evidence.
- There is evidence of that even more sulfates can be found under the existing dust.

**These things give us reason to conclude that the channel at 2.8 S, 74.62 W would be a good place to land the MSL to investigate.**
